

## Transcript of video Fractions as Measures

<http://topdrawer.aamt.edu.au/Fractions/Big-ideas/Fractions-as-a-measure/Using-the-measure-model>

The use of linear models such as folding paper strips or string into equal lengths is helpful for thinking of fractions as expressing measure.

In this example, a length of rope has been folded into four equal lengths.

*(Rope folded and marked into four equal lengths)*

The full length of rope is considered to be one whole.

*(Indicating full length of the rope)*

Notice that the fold line has been labelled with one-quarter because that marks the length from the start of the rope.

*(One-quarter length of rope is marked)*

As we move along the length of the rope, the fraction tells us the accumulated distance from the start.

*(Marking the next quarter of the rope)*

One quarter is a unit of measure and we are counting how many units.

*(Counting units each of one-quarter)*

Here, we have counted four quarters, which is the same as one whole.

*(Marking four quarters of the rope)*

Similarly, fractions marked on a number line indicate the number of units' distance from zero.

*(Fractions marked on the number line)*

In this case, the unit of measure is one fifth.

*(One-fifth unit marked)*

Thinking of fractions as units of measure helps to make sets of tasks like 'find two fractions between two-fifths and three-fifths' because in measurement there are always smaller units that can be created by subdividing the current units.

*(Explaining the use of fractions to divide units)*

Locating fractions of different denominators on the same number line is quite a complex task because the range of units needs to be visualised.

*(Explaining way to locate fractions of different units)*

Equivalent fractions are found to occupy the same position on the number line.

*(Marking equivalent fractions)*

The number line model is also helpful for reinforcing the understanding that a fraction is actually a number that has a value that can be located on a number line in relation to other numbers.

*(Explaining use of number line)*

A number line can also be extended beyond 1 to illustrate improper fractions and mixed numbers.

*(Explaining use of number line)*
